Welcome to the Engineering Institute of Technology (EIT)

The Engineering Institute of Technology (EIT) provides endorsed engineering Diplomas and Certificates (Masters Degrees accreditation pending), designed for students working in industry who need a practical, relevant education that is delivered efficiently. Our students work in the fast-moving engineering and technology fields where time is precious. They choose the EIT online delivery because it provides many of the benefits of live classroom based study without the inconvenience of travel. EIT courses are run by expert instructors who present in a friendly, interactive manner.

The EIT offers engineering Diplomas and Certificates (Masters Degrees accreditation pending) in the areas of:

Objectives

- Quickly interpret, isolate and fix common hardware problems related to PLC input/outputs
- Troubleshoot PLC software
- Identify data communications problems

Topics

- Introduction to PLC
- Internal or External Problem
- Internal Problems
- External Problems - I/O and Comms
- Applications
- Conclusion

Industrial Automation Skills

“Today’s Industrial Automation engineer and technician should be able to troubleshoot, identify, prevent and fix common PLC and SCADA problems.

If you have worked in industry, you are probably familiar with PLCs and SCADA systems and understand their basic operation.

You want to be able to quickly diagnose problems using your PLC software; know how to connect to the right PLC processor online, make minor changes to get the machine running and have the know-how to test new ideas and hardware components. In addition, you want to be able to do troubleshooting and problem solving of your associated SCADA system”.

Introduction to the PLC

Introduction to the PLC

- “PLC” means “Programmable Logic Controller”. The word “Programmable” differentiates it from the conventional hard-wired relay logic
- The PLC as a unit consists of a processor to execute the control action on the field data provided by input and output modules
- In a programming device, the PLC control logic is first developed and then transferred to the PLC
- PAC or Programmable Automation Controller

What can a PLC do?

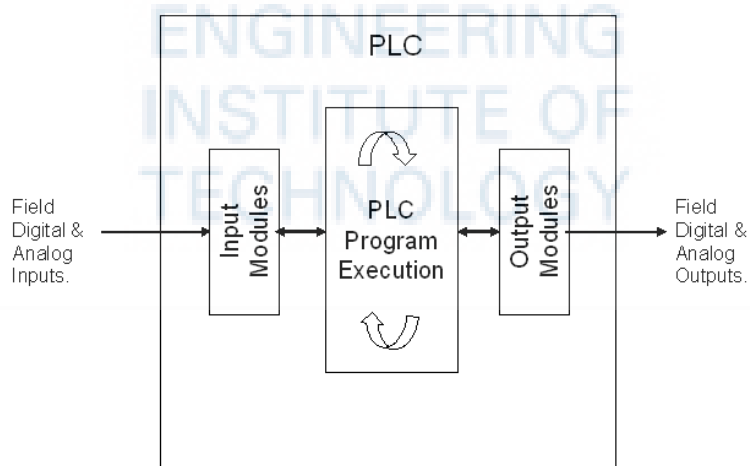

- It can perform relay-switching tasks.
- It can conduct counting, calculation and comparison of analog process values.
- It offers flexibility to modify the control logic, whenever required, in the shortest time.
- It responds to the changes in process parameters within fraction of seconds.
- It improves the overall control system reliability.
- It is cost effective for controlling complex systems.
- Trouble-shooting becomes simpler and faster.
- An operator can easily interact with the process with the help of the HMI (Human-Machine Interface) computer.

Internal or External Problem?

- Over 80% of malfunctions are with I/O modules and field equipment
- Problems related to specific I/O module or I/O device are external problems
- Large groups of failures – internals of PLC

Internal Problems

TECHNOLOGY

Internal Problems

- Check earthing/grounding is correct
- Check power supply to PLC is within correct range and ac ripple on dc supplies is not excessive
- Batteries on PLC are OK
- PLC program hasn't been corrupted
- Examine internal diagnostics for a crash of PLC program

External Problems

External Problems: Digital Inputs

- Check Power supply to module
- Look for where power to digital Input comes from
- Check fuses/breakers
- Adequate changes of voltage to Input
- Digital input fine ==> PLC program problem

Discrete DC Input Module

External Problems – digital outputs

- Check Power supply to module
- Check power output from PLC
- Check fuses
- Force digital outputs on and off
- Use test load rather than open circuit – why ?

External Problems: Analog Inputs

- Move field device through full range of current – 4-20mA
- Hook up signal transmitter if you need to be absolutely sure.

External Problems: Analog Outputs

- Force output to specific value and observe
- Check external wiring

Remote troubleshooting

- Be careful with remote troubleshooting about industrial network security
- Hackers are about 24x7

Thorny transients

- Fiber Optics where possible
- Good earthing/grounding for data comms

A typical shield

The purpose of the shield is to reduce the magnitude of the noise coupled into the low-level signal circuits by electrostatic or magnetic coupling. This has brushed up the above-mentioned concepts up to some extent

Opto-electric coupler circuit

When in doubt -disconnect

- Test with dummy equipment not 1MW ball mills
